

Cisco eBGP option C – MPLS L3VPN

EVE-NG version: 5.0.1-22

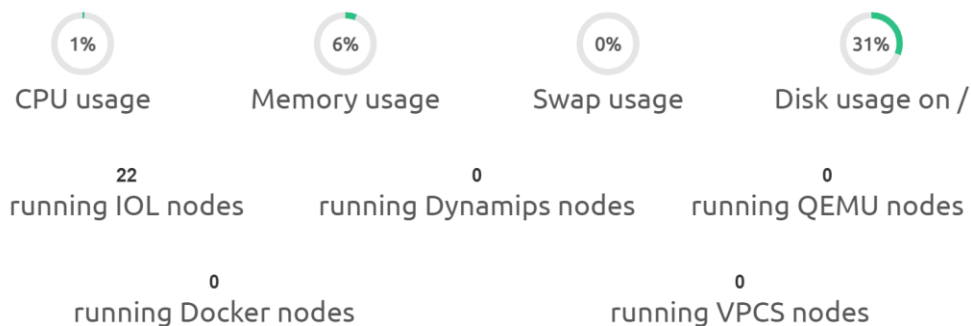

QEMU version: 2.4.0

UKSM Status: ON

CPU Limit Status: ON

Role: admin

POD: 0

Использованные образы:

i86bi_LinuxL3-AdvEnterpriseK9-M2_157_3_May_2018.bin

0. Summary

В данной лабораторной работе необходимо обеспечить связность между сайтами клиентов, подключенных к разным автономным системам. Для этого необходимо организовать interAS-стык по схеме «option C».

Данную задачу можно разбить на две последовательные подзадачи:

1. Поднятие interAS-стыка в AFI/SAFI IPv4 Labeled-unicast между ASBR'ами.
2. Поднятие interAS-стыков в AFI/SAFI VPNv4 Unicast между рефлекторами, расположенных в разных AS.

1. IPv4 Labeled Unicast

В первую очередь, нам необходимо организовать транспортные LSP между маршрутизаторами, расположенными в разных AS.

Для этого сначала поднимем в каждой AS iBGP-сессии в ipv4 labeled-unicast:

ISP01-ASBR-R1	ISP01-R2	ISP01-R3
router bgp 64501 address-family ipv4 network 10.255.255.1 mask 255.255.255.255 neighbor 10.255.255.7 activate neighbor 10.255.255.8 activate neighbor RR send-community neighbor RR send-label explicit- null exit-address-family ! !	router bgp 64501 address-family ipv4 network 10.255.255.2 mask 255.255.255.255 neighbor 10.255.255.7 activate neighbor 10.255.255.8 activate neighbor RR send-community neighbor RR send-label explicit- null exit-address-family ! !	router bgp 64501 address-family ipv4 network 10.255.255.3 mask 255.255.255.255 neighbor 10.255.255.7 activate neighbor 10.255.255.8 activate neighbor RR send-community neighbor RR send-label explicit- null exit-address-family ! !

ISP01-RR-R8#
```

В RIB маршруты есть, а вот в LFIB, как ни странно, соответствия меток и префиксов нужных нет. Посмотрим, что у нас видно в BGP:

```
ISP01-RR-R8#show bgp ipv4 unicast labels
Network      Next Hop      In label/Out label
10.255.255.1/32 10.255.255.1  nolabel/exp-null
10.255.255.1/32 10.255.255.1  nolabel/exp-null
10.255.255.2/32 10.255.255.2  nolabel/exp-null

10.255.255.8/32 0.0.0.0       imp-null/nolabel
172.16.255.9/32 10.255.255.1  nolabel/10001
172.16.255.9/32 10.255.255.1  nolabel/10001
172.16.255.10/32 10.255.255.1  nolabel/10002
172.16.255.10/32 10.255.255.1  nolabel/10002
172.16.255.11/32 10.255.255.1  nolabel/10011
172.16.255.11/32 10.255.255.1  nolabel/10011
172.16.255.12/32 10.255.255.1  nolabel/10012
172.16.255.12/32 10.255.255.1  nolabel/10012
172.16.255.13/32 10.255.255.1  nolabel/10013
172.16.255.13/32 10.255.255.1  nolabel/10013
```

```

172.16.255.14/32 10.255.255.1 nolabel/10014
                  10.255.255.1 nolabel/10014
172.16.255.15/32 10.255.255.1 nolabel/10015
                  10.255.255.1 nolabel/10015
172.16.255.16/32 10.255.255.1 nolabel/10016
                  10.255.255.1 nolabel/10016

```

Здесь мы видим, что метки для лупбэков из AS64502 получены. Посмотрим более детально на какой-нибудь из префиксов:

```

ISP01-RR-R8#show bgp ipv4 unicast 172.16.255.9/32
BGP routing table entry for 172.16.255.9/32, version 10
Paths: (2 available, best #2, table default)
  Advertised to update-groups:
    1          2
  Refresh Epoch 1
64502
  10.255.255.1 (metric 200) from 10.255.255.7 (10.255.255.7)
    Origin IGP, metric 0, localpref 100, valid, internal
    Originator: 10.255.255.1, Cluster list: 10.255.255.7
    mpls labels in/out nolabel/10001
    rx pathid: 0, tx pathid: 0
  Refresh Epoch 5
64502, (Received from a RR-client)
  10.255.255.1 (metric 200) from 10.255.255.1 (10.255.255.1)
    Origin IGP, metric 0, localpref 100, valid, internal, best
    mpls labels in/out nolabel/10001
    rx pathid: 0, tx pathid: 0x0
ISP01-RR-R8#

```

Мы видим, что маршрут валиден, нормально резолвится через 10.255.255.1.
Давайте глянем на то, что видно в FIB:

```

ISP01-RR-R8#show ip cef 172.16.255.9/32 detail
172.16.255.9/32, epoch 0, flags [rib defined all labels]
  recursive via 10.255.255.1 label 10001
  nexthop 10.2.8.2 Ethernet0/1 label 20005-(local:80007)
ISP01-RR-R8#

```

Здесь мы видим, что используется стек меток: внешняя метка - это метка next-hop'a 10.255.255.1, а внутренняя - это метка, полученная по BGP вместе с префиксом. Т.о., в LSP R8 > R16 используется пара меток на участке R8 - R1, а после выхода с R1 остается только одна метка.

Проверим связность:

```

ISP01-RR-R8#ping 172.16.255.16 source Lo0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.255.16, timeout is 2 seconds:
Packet sent with a source address of 10.255.255.8
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 2/2/2 ms
ISP01-RR-R8#traceroute 172.16.255.16 source Lo0
Type escape sequence to abort.
Tracing the route to 172.16.255.16
VRF info: (vrf in name/id, vrf out name/id)
 1 10.2.8.2 [MPLS: Labels 20005/10016 Exp 0] 3 msec 2 msec 3 msec
 2 10.1.2.1 [MPLS: Labels 0/10016 Exp 0] 3 msec 2 msec 2 msec
 3 192.0.2.1 [MPLS: Label 90003 Exp 0] 3 msec 3 msec 3 msec
 4 172.31.109.10 [MPLS: Label 100005 Exp 0] 3 msec 2 msec 3 msec
 5 172.31.116.16 2 msec * 3 msec
ISP01-RR-R8#

```

Собственно, трейс подтверждает вышесказанное. На R1 происходит своп метки 10016 на 90003 и отдается в сторону R9:

```

ISP01-ASBR-R1#show mpls forwarding-table labels 10016
Local   Outgoing Prefix      Bytes Label  Outgoing  Next Hop
Label   Label   or Tunnel Id Switched    interface
10016   90003   172.16.255.16/32 2380       Et0/3     192.0.2.1
ISP01-ASBR-R1#

```

2. VPNv4 Unicast RR <> RR

На данный момент у нас есть связность между рефлекторами, поэтому приступаем к настройке eBGP-сессий в VPNv4 Unicast.

ISP01-RR-R7 / ISP01-RR-R8	ISP02-RR-R15 / ISP02-RR-R16

ISP01-R4#

```

Здесь мы видим, что маршруты были получены от наших RR, next-hop'ом считается 172.16.255.16, VPN-метка 160011.

Давайте попробуем проверить связность между CPE02-R19 и CPE02-R20:

```

CPE02-R19#ping 172.16.0.20 source Lo0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.0.20, timeout is 2 seconds:
Packet sent with a source address of 172.16.0.19
!!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/5 ms
CPE02-R19#traceroute 172.16.0.20 source Lo0
Type escape sequence to abort.
Tracing the route to 172.16.0.20
VRF info: (vrf in name/id, vrf out name/id)
 1 10.104.119.104 1 msec 0 msec 1 msec

8	10.112.120.20	Пакет от ISP02-R12 до CPE02-R20: POP на R12 метки 0 POP на R12 метки 120001

Собственно, из трейса мы видим, что трафик до R20 проходит через ISP02-RR-R16. Визуально, конечно, это выглядит субоптимальным путем, однако, вполне возможно, что PE R12 действительно доступен через RR. На всякий случай сделаем трейс от R4 до R12:

```
ISP01-R4#traceroute 172.16.255.12 source Loopback0
Type escape sequence to abort.
Tracing the route to 172.16.255.12
VRF info: (vrf in name/id, vrf out name/id)
 1 10.2.4.2 [MPLS: Labels 20005/10012 Exp 0] 2 msec 2 msec 1 msec
 2 10.1.2.1 [MPLS: Labels 0/10012 Exp 0] 2 msec 2 msec 2 msec
 3 192.0.2.1 [MPLS: Label 90007 Exp 0] 2 msec 2 msec 2 msec
 4 172.31.109.10 [MPLS: Label 100009 Exp 0] 2 msec 2 msec 2 msec
 5 172.31.112.12 3 msec * 3 msec
ISP01-R4#
```

По трейсу видно, что до ISP02-R12 трафик проходит напрямую от R10, не проходя через ISP02-RR-R16.

Давайте разбираться, почему так получается. Сначала посмотрим на R4:

```
ISP01-R4#show bgp vpnv4 unicast vrf CUST2 172.16.0.20/32

```

Здесь мы видим, что маршрут мы получили от нашего RR 10.255.255.7, в качестве next-hop стоит 172.16.255.16. Почему? А потому что у нас созданы eBGP VPNv4 сессии между RR. Т.к. это eBGP, то по умолчанию в качестве next-hop проставляется адрес соседа, от которого эти маршруты получены (в нашем случае это 172.16.255.15 и 172.16.255.16).

В общем-то, на данный момент все работает, но, все же, лучше привести к нормальному виду. Для это нам необходимо на RR включить команду next-hop-unchanged в сторону RR из соседней AS (ну и не забыть переанонсировать маршруты).

ISP01-RR-R7 / ISP01-RR-R8	ISP02-RR-15 / ISP02-RR-16
router bgp 64501 ! address-family vpnv4 neighbor RR_OPT next-hop-unchanged	router bgp 64501 ! address-family vpnv4 neighbor RR_OPT next-hop-unchanged

<pre>exit-address-family ! ! clear bgp vpnv4 unicast * out</pre>	<pre>exit-address-family ! ! clear bgp vpnv4 unicast * out</pre>
--	--

После того, как мы выполнили эти настройки, проверим, что сейчас видно на R4:

```
ISP01-R4#show bgp vpnv4 unicast vrf CUST2 | b Network
      Network      Next Hop      Metric LocPrf Weight Path
Route Distinguisher: 10.255.255.4:1002 (default for vrf CUST2)
*> 10.104.119.0/24 0.0.0.0      0      32768 ?
*>i 10.112.120.0/24 172.16.255.12 0      100      0 64502 ?
*> 172.16.0.19/32 10.104.119.19 11      32768 ?
*>i 172.16.0.20/32 172.16.255.12 0      100      0 64502 ?
ISP01-R4#
```

Сейчас у нас в качестве next-hop'ов стоит R12, чего мы и добивались. Проверим прохождение трафика еще и трейсом с CPE02-R19:

```
CPE02-R19#traceroute 172.16.0.20 source Lo0
Type escape sequence to abort.
Tracing the route to 172.16.0.20
VRF info: (vrf in name/id, vrf out name/id)
 1 10.104.119.104 2 msec 35 msec 1 msec
 2 10.2.4.2 [MPLS: Labels 20005/10012/120001 Exp 0] 8 msec 17 msec 18 msec
 3 10.1.2.1 [MPLS: Labels 0/10012/120001 Exp 0] 19 msec 8 msec 8 msec
 4 192.0.2.1 [MPLS: Labels 90007/120001 Exp 0] 8 msec 7 msec 5 msec
 5 172.31.109.10 [MPLS: Labels 100009/120001 Exp 0] 4 msec 3 msec 2 msec
 6 10.112.120.12 [MPLS: Labels 0/120001 Exp 0] 3 msec 2 msec 2 msec
 7 10.112.120.20 3 msec * 9 msec
CPE02-R19#
```

На данный момент трафик на R12 идет напрямую с R10, т.о. мы получили оптимальный путь прохождения трафика.
